## Thermodynamics

Usually I have you start with electricity (dryer room)
We're going to start with Thermodynamics instead.
$\Rightarrow$ Good inductive/deductive skills development.
Thermodynamics - study of Temperature, Internal Energy, Energy
Transfer, State Change $\Rightarrow$ Laws of Thermodynamics
As usual, the fun stuff to study is how quantities change.

- In mechanics $\rightarrow$ could see the changes (position, velocity, etc.)
- In thermo. $\rightarrow$ can't see most changes ( 1 exception - Vol. of gas)
$\Rightarrow$ need to measure quantities indirectly.
- Thermometers
- Pressure sensors
$\Rightarrow$ or calculate quantities indirectly.
- Internal Energy
- Energy Transfer (Work, Heat)

## Unit 16.1

Today - Look at:

- Temperature
- Temperature scales
- How to measure temperature
- Factors that affect accurate temperature measurements $\Rightarrow$ Qualitative look at factors involved in temperature changes.

## Unit 16.2

Just need a simple definition of how a glass bulb thermometer works.

## Unit 16.3

There are 4 temperature scales in common use.

- Celsius, Fahrenheit $\quad \Rightarrow$ Relative Scales
- Kelvin, Rankine $\quad \Rightarrow$ Absolute Scales

Units for temperature are degrees + scale used.

- 1 exception: Kelvin $\rightarrow$ no degrees, just the scale.

Defining a temperature scale is somewhat arbitrary, but the fixed points must be repeatable.

- You will define and create your own temperature scale.

Conversions between scales:

- ${ }^{\circ} \mathrm{F} \&{ }^{\circ} \mathrm{C}$ are relative scales - slope and constant term.
- Be careful to include units of slope and constant term.

|  | Kelvin （K） | Celsius $\left({ }^{\circ} \mathrm{C}\right)$ | Fahrenheit $\left({ }^{\circ} \mathrm{F}\right)$ | Rankine $\left({ }^{\circ} \mathrm{R}\right)$ |
| :---: | :---: | :---: | :---: | :---: |
| Water Boils |  | $100$ |  | $672$ |
| Body |  |  | 严 |  |
| Temp． | － 310 | － 37 | 的 98.6 | 558.6 |
| Room | － 293 | 20 | 筹 68 | 三 528 |
| Temp． |  | 0 | $\begin{array}{\|c\|c} \hline= & 32 \end{array}$ | 契492 |
| Water <br> Freezes |  |  | 丰 | ${ }^{\prime \prime}$ |
| Absolute Zero | $\left[\begin{array}{ll} \underline{-} \\ \bar{z} \\ \hline \end{array}\right.$ | －273 | 隶 | 啥 0 |

Most of the world is metric and uses the Celsius temperature scale.

## Unit 16.4, 16.5

We want the most accurate temperature measurements we can get.

- Good calibration of an electronic temperature sensor.
- Look at factors that affect temperature measurements.
